

# Integrating multiple brands of inverters

## The Problem

Sites using mixed inverter brands often struggle to maintain consistent communication and export control. Without a unified system, DNSPs can't control the entire site and export limits won't be met.

## Our Solution

Marshall integrates multiple inverter types into one seamless ecosystem. Whether via local hardware or remote network discovery, Marshall detects, communicates with, and controls all inverters through the same interface. All data and commands are unified in the Marshall dashboard, giving operators one source of truth.

## Outcome

**Regardless of brand, the site behaves as a single, coordinated system. Export limits, data logging, and performance metrics are handled centrally, improving operational efficiency and ensuring compliance without vendor lock-in.**
